

Having successfully worked previously on a number of Travis Perkins sites throughout the country, we were tasked with designing and installing a brand new Public Address system for their newly acquired Appleton site.

After outgrowing and relocating from their old site, the company realised that a larger scale communication system was absolutely vital in order to maintain efficiency in such a large site. The new public address system is linked to the existing telephone system and covers all internal and external areas, allowing employees to use it regardless of where they are onsite.

PAS worked hand in hand with Travis Perkins' communications department throughout to design and install the scheme. The final result is a much more efficient communications system.
